## Functional Testing

Process of applying industry best practice testing methodologies to support today's development processes. Test methodologies employed, but not limited to: System Integration, User Acceptance, Mobile, Compatibility & Interoperability, Usability, Localization, and Data Warehousing BI testing. This testing is performed against the business and system requirements of the application and involves the complete integration of the end-to-end system.

## Test Automation

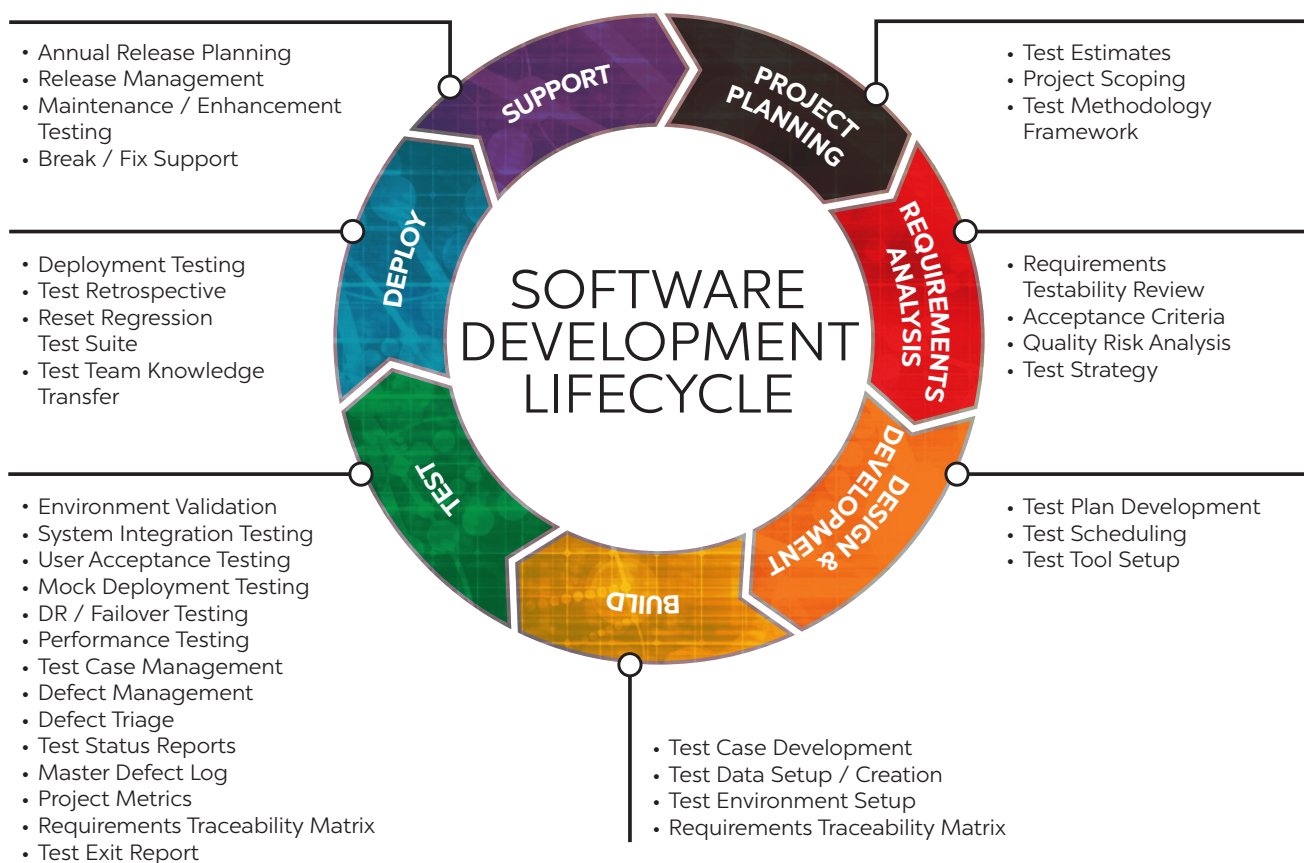

Process of automating repetitive but necessary tests in a formalized testing process such as regression tests but does not replace manual testing. The automation tests augment the testing suite to improve test coverage, efficiency and speed to market.

## Performance Testing

Process of evaluating an application or system against performance requirements through analysis, tuning, optimization or refactoring. This testing includes validating response times, throughput and finding breaking points using load, stress, endurance, volume and scalability testing techniques.

## QA Assessments

Process of providing an independent review of the Quality Assurance and Quality Control processes employed in the SDLC to determine the methodologies, processes, policies and procedures that may or may not be in place. At the conclusion of a QA Assessment, a report of findings including an Improvement Roadmap, will be provided with recommendations for implementation.

Bulletproof has been providing value to our clients since 2001 and we want to be your Trusted IT Provider. We offer a suite of services including IT/Cybersecurity Services, Professional and Managed Services, as well as Education Services. For more information about Bulletproof please visit our site or call us at 1-866-328-5538.
